Appendix for Power at Sea Naval Dataset 2.0

Codebook

The following describes the variables available in the Power at Sea dataset version 2.0.

Tonnage Variables

- `base_ton` – This is the base tonnage for a state from Crisher-Souva version 1.0 with one notable exception. Now this variable does not include the tonnage for amphibious assault ships. This covers 1865 to 2025.
- `amp_tonNA` – This is the tonnage of amphibious ships for a state (not including assault ships) from 1955 to 2025.
- `amp_tonFULL` – This is the complete amphibious tonnage, including assault ships.
- `base_assault_ton` – This is tonnage that includes base tonnage and assault ship tonnage. This measure most closely recreates the total tonnage measure from the Crisher-Souva version 1.0 dataset. The recreation won't be exact due to expanded coverage of assault ships in the update, along with the correction of previous errors.
- `assault_ton` – This is the tonnage of amphibious assault ships for a state from 1960 to 2025.
- `grandtotal_ton` – This is a grand total of tonnage that includes the base and amphibious tonnage. Note this will only differ from `base_ton` from 1955-2025.
- `ballsub_ton` – This is the total tonnage for ballistic missile submarines.

Proportional Variables

- `base_prop` – This is the tonnage proportion for the base tonnage (1865-2025).
- `amp_prop` – This is the tonnage proportion for amphibious tonnage (1955-2025). This includes assault ships.

- `base_assault_prop` – This is the tonnage proportion for base and assault ship tonnage (1865-2025). This measure most closely recreates the tonnage proportion measure from the Crisher-Souva version 1.0 dataset. Again, the recreation will not be exact. Note that assault ships don't enter the dataset until 1960.

- `grandtotal_prop` – This is the tonnage proportion for base and amphibious tonnage (1865-2025). Note that amphibious tonnage starts in 1955.

Count Variables

- `BaseShips` – This is the total number of ships for a state that makes up the `base_ton` measure.

- `AmphShips` – This is the total number of amphibious ships (including assaults) that make up the `amp_tonFULL` measure.

- grandtotal_count – This is the total number from combining `BaseShips` and `AmphShips`.

- `bigship10k` – This is the number of base ships that exceed 10,000 tons displacement.

- `bigship7500k` – This is the number of base ships that exceed 7,500 tons displacement.

- `bigship5k` – This is the number of base ships that exceed 5,000 tons displacement.

- `AircraftCarriers` – This is the number of aircraft carriers from 1906 to 2025.

- `Battleships` – This is the number of battleships from 1906 to 1992. 1906 marks the launch of the HMS *Dreadnought*. 1992 is when the United States finally decommissions the last of the *Iowa* class battleships.

- `NukeAttSubs` – This is the number of nuclear attack submarines from 1954 to 2025. This also contains nuclear guided-missile submarines (SSGNs).

- `DieselSubs` – This is the number of diesel submarines from 1906 to 2025.

- `bigships10k_amp` – This is the number of amphibious ships that exceed 10,000 tons displacement.
- `assault_ships` – This is the number of amphibious assault ships from 1960 to 2025. Assault ships include LHAs, LPHs, and LHDs.
- `maj_logistic` – This is the number of major logistic ships from 1955 to 2025. Major logistic ships include LPDs and LSDs.
- `BallisticSubs` – This is the total number of ballistic missile submarines from 1959 to 2025.
- `bigship10k_grandtotal` – This is the total of base and amphibious ships that displace more than 10,000 tons. Excludes ballistic missile submarines.

Overall Naval Power

- `navy_strength` – This is a new measure of naval power. It represents a state's total tonnage squared divided by its total number of ships.

Additional Model Estimates

Table 1: Seemingly Unrelated Regression Estimates on Count of 5k Ships, Asia 2000-2025

	China	Japan	Aus	S.Korea	India
L3.Ln(China 5k Ships)	0.179	0.157***	0.460***	0.544	0.309**
	(0.248)	(0.032)	(0.127)	(0.306)	(0.119)
L3.Ln(Japan 5k Ships) 0.575	**	0.445***			
	(0.182)	(0.063)			
L3.Ln(Australia 5k Ships)	***		0.560***		
0.494	(0.128)		(0.168)		
				**	
L3.Ln(S. Korea 5k Ships)	0.119			0.479	
L3.Ln(India 5k Ships)	0.142				0.404*
	(0.158)				(0.166)
Constant	0.200	1.427***	-1.016**	-0.520	0.484***
	(0.339)	(0.120)	(0.331)	(0.639)	(0.115)
N	26				
Breusch–Pagan Chi^2	19.1				
BP p-value	0.040				
(0.072)					(0.180)

5k Ships are ships that displace at least 5000 tons * $p <$ 0.05, ** $p < 0.01$, *** $p < 0.001$

Table 2: Seemingly Unrelated Regression Estimates on Count of 5k Ships, S. America 1890-1902

	Argentina	Chile
L3.Ln(Argentina 5k Ships)	0.141	-0.014
	(0.225)	(0.075)
L3.Ln(Chile 5k Ships)	1.148***	0.561***
	(0.308)	(0.103)
Constant	-0.095	0.672***
	(0.196)	(0.065)
N	13	
Breusch–Pagan Chi^2	6.5	
BP p-value	0.011	

5k Ships are ships that displace at least 5000 tons $^{*}p <$ 0.10, $^{**}p < 0.05$, $^{***}p < 0.01$
